Problem  Pollution often goes undetected for hours or days Manual testing is slow, infrequent, needs experts Agencies react only after damage is visible	Solution  Hourly automated pH / turbidity / O2 monitoring AI-written pollution & impact assessment Instant authority alerts + incident log	Unique Value Prop.  Turns sensor readings into an AI-written pollution report and authority alert — in minutes, not days	Unfair Advantage  Detection-to-alert pipeline paired with a domain-tuned AI "scientist" agent, plus a growing incident dataset	Customer Segments  Municipal water authorities Environmental protection agencies Industrial wastewater sites Aquaculture & fisheries operators
Existing Alternatives  Manual lab water sampling Static IoT dashboards nobody watches live Waiting for public complaints	Key Metrics  Readings processed per hour Incidents detected Time from detection to alert False positive rate	High-Level Concept  "A smoke alarm for waterways"	Channels  Municipal water authorities Utility & IoT sensor partnerships Environmental NGOs Government tenders	Early Adopters  Water districts with sensors but no automated alerting River & lake conservation NGOs Industrial sites under regulatory pressure to self-monitor
Cost Structure  Sensor / data feed costs Cloud & automation hosting AI / LLM API usage per assessment Customer acquisition Engineering & compliance staff			Revenue Streams  Per-site monthly subscription Tiered pricing by monitoring points Incident-response consulting Government monitoring contracts
